## Training-Inference Governance Integration

by [Nick Clark](#) | Published March 27, 2026 | [PDF](#)

Governance applied during training must be consistent with governance applied during inference. A model trained under specific content depth restrictions should enforce compatible restrictions during inference. Training-inference governance integration ensures this consistency by deriving inference governance constraints from training governance records, creating a unified governance lifecycle from training through deployment.

---

### What It Is

Training-inference governance integration links the governance policies applied during training to the governance policies enforced during inference. Content that was restricted to shallow integration during training should not be deeply relied upon during inference. Content classes excluded from training should not appear in inference outputs as if the model had learned them.

## Why It Matters

Disconnected training and inference governance creates inconsistencies. A model might be trained to avoid memorizing specific content but then be deployed without corresponding inference restrictions, allowing it to reconstruct memorized patterns through creative prompting. Integrated governance prevents such inconsistencies by ensuring inference constraints match training constraints.

## How It Works

The training lineage includes a governance manifest that summarizes the training policies applied: which content classes were admitted at which depths, what memorization thresholds were enforced, and what content was excluded. The inference governance system reads this manifest and applies compatible constraints: content trained at shallow depth is restricted from deep inference reliance; excluded content classes trigger inference-time guardrails.

## What It Enables

Training-inference integration enables end-to-end governance where training decisions propagate to deployment constraints automatically. Models carry their governance manifest with them, and any deployment environment can configure appropriate inference governance based on how the model was actually trained. This creates consistent, auditable governance across the entire model lifecycle.
